Introduction to the Third Edition of the HMW-GS database

Based on responses received after the publication of the 1st version, the HMW glutenin subunit allele database is proving to be a useful tool for experts working in the various aspects of wheat science and technology. With the help and contributions of many individuals, it has been possible to improve and significantly enlarge the database. Several duplications, and errors of data and spelling, have been corrected and a large number of new entries has been added, increasing the total number of cultivars/lines involved to over 7,830, derived from 18 new research publications, personal communications and some international collaborations directly aiming for the identification of HMW-Gs alleles in large sample populations from Kazakhstan/Siberia, Hungary and China. The names of all contributing individuals have been added to the Acknowledgement Section below. The agreement between AACCI and CIMMYT, on exchanging data on their existing databases, has significantly improved the quality of this work.

Compared to the first two versions, we now cover a large number of breeder lines from the various nursery programs of CIMMYT. These entries mostly contain pedigree information in their “Name/Cross” cell; in addition, the official abbreviation of the nursery program is given in the “Origin” column. These two entries clearly identify these lines. There are numerous occasions where several genetic combinations from the same cross have been selected, providing “families” of lines with different HMW-GS combinations in the same genetic background.

Introduction to the First Edition of the HMW-GS database

Many lists of HMW-subunit composition and the corresponding *Glu-1* alleles have been published, because of the importance of the high-molecular-weight (HMW) subunits of glutenin in determining and predicting dough properties. In this compilation of this information, references are given to these publications, cited against each entry, with the full reference being given in “Literature cited” section at the end of this introductory text. In other cases, the sources of the information are

indicated in the table. Details of the nomenclature used are provided in Chapter 1 of the AACC International's book "Gliadin and Glutenin: The Unique Balance of Wheat Quality".

Difficulties in identifying specific subunits

Specific mention should be made of HMW subunit 7. Differentiation between subunits 7 and 7* (alleles *Glu-B1d* and *Glu-B1u*, respectively) is sometimes difficult, but their respective contribution to dough properties is significantly different and significant (Bekes et al 2004). In particular, there is the recent realization that subunit 7 is over-expressed in some genotypes (Butow et al 2003, Gianibelli et al 2002, Juhasz et al 2003, Vawser and Cornish 2004). The greater quantity of this subunit, in such cases, increases its contribution to dough strength considerably. It is thus important to differentiate among alleles *Glu-B1d*, *Glu-B1u* and *Glu-B1a*, but this may not be signified in the list for HMW subunits, especially for those sources dated prior to 2000.

Over-expressed 7 is readily distinguished from normal expression of band 7 using SDS-PAGE when run alongside reference varieties. PCR techniques may also be used in breeding programs to screen progeny to differentiate among alleles with different subunit 7 subunits (Lei et al 2006). RP-HPLC and the Lab-on-a-chip system are valuable in quantifying the band (or peak) representing subunit 7, and thus detecting the over-expressed version (Marchylo et al 1989, Vawser and Cornish 2004, Uthayakumaran et al 2006).

There are also scoring inconsistencies in the literature for some cultivars at the *Glu-B1* locus for the 14+15 and 20 HMW glutenin subunits. Due to the close proximity of these bands when using SDS-PAGE there are a number of cultivars that may be mis-classified, usually with the 14+15 subunits being classified as the 20 subunit.

To assist in the practical task of identifying the HMW subunits of glutenin, a list of primary standards for them has been proposed (Table 1). Authentic sources of these genotypes are indicated according to AUS accession numbers from the Australian Winter Cereals Collection, Tamworth, NSW, Australia.

Table 1. Primary standards for allocating allele designations for HMW subunits of glutenin

Locus	Allele	Primary Standard	AUS #
<i>Glu-A1</i>	<i>A</i>	Kukri	29472
	<i>B</i>	Cheyenne	2123
	<i>c</i>	Chinese	110
